

TEST PLAN

It is very important to have a reliable site without defects since being an e-commerce site it will have a lot of interaction with users, therefore it is required to carry out tests to corroborate that it works and detect as many defects as a user can generate.

This repository will have a validation script and end to end to the E-commerce site

<http://automationpractice.com>

The tests for the site will begin right after finishing the Testcafe course given by the mentor of QAminds "Saida Reyes".

The JavaScript scripts generated in this repository will be executed on a laptop with the following characteristics:

MacOs Processor: Intel Core i7 Memory: 16 GB

They will run on 2 web browsers:

Google Chrome FireFox

All tests performed on the site will be done through the framework called "TestCafe" which has the function of running scripts made with JavaScript in browsers without a graphical interface.

TestCafe needs a person who, through instructions, tells it which browsers to run and how and when to do it.
